ESIP Winter Conference, January 9, 2013

# About SERVIR

A NASA-USAID partnership to **improve environmental management and resilience to climate change** by strengthening the capacity of governments and other key stakeholders to integrate earth observation information and geospatial technologies into development decision-making

# Space to Village

**NASA Sub-Goal 3A:  
Study Earth from space to  
advance scientific  
understanding and meet  
societal needs.**

**USAID has renewed focus on  
integrating science,  
technology, and innovation in  
the practice of development to  
solve today's most pressing  
development challenges  
around the globe.**

# SERVIR Network

- Current Hub
- Graduated Hub
- Program Office (NASA/MSFC)
- Potential Future Hubs

**SERVIR Network**

**RCMRD** – Host of SERVIR-East Africa

**ICIMOD** – Host of SERVIR-Himalaya

**CATHALAC**– Graduated Hub/Network Affiliate

# SERVIR-Mesoamerica @ CATHALAC

City of Knowledge, Panama

Dedicated 2005  
Graduated 2011

# SERVIR-Africa @ RCMRD

Nairobi, Kenya

Dedicated on  
November 21, 2008

# SERVIR-Himalaya @ ICIMOD

## Kathmandu, Nepal

Dedicated on October 5, 2010

ICIMOD

# 'South-South' Collaboration

Centers are exchanging  
ideas and sharing  
experiences

# What We Do

- Capacity Building of Regional Institutions, Stakeholders, and Young Professionals
- Improved Access to Data, Models, Online Maps, Visualizations
- Development of Decision Support Tools and Services
- Strengthening Partnerships and Fostering Collaboration Across SERVIR Network

# SERVIR Thematic Areas

- Agriculture
- Biodiversity
- **Climate**
- Disasters
- Ecosystems
- **Energy**
- Health
- Water
- Weather

SERVIRGlobal.net

SERVIRGlobal.net

- 3 objectives (SERVIR contribution):
  1. Invest in clean energy technology and reduce deforestation to decrease greenhouse gas emissions.
  2. Help countries and communities prepare for and respond to changes in climate.
  3. Make climate change considerations part of all aspects of USAID's programs and operations.

## USAID's Climate Change & Development Strategy (2012 – 2016)

- USAID Criteria for prioritizing dedicated climate change funds for adaptation:
  1. Vulnerable countries – exposure to physical impact & socio-economic sensitivity to those impacts.
  2. Least developed countries (especially in sub-Saharan Africa), small island developing states, and glacier-dependent countries.
- SERVIR hubs serve countries that meet these criteria.

# Global partnerships

SERVIR  GLOBAL

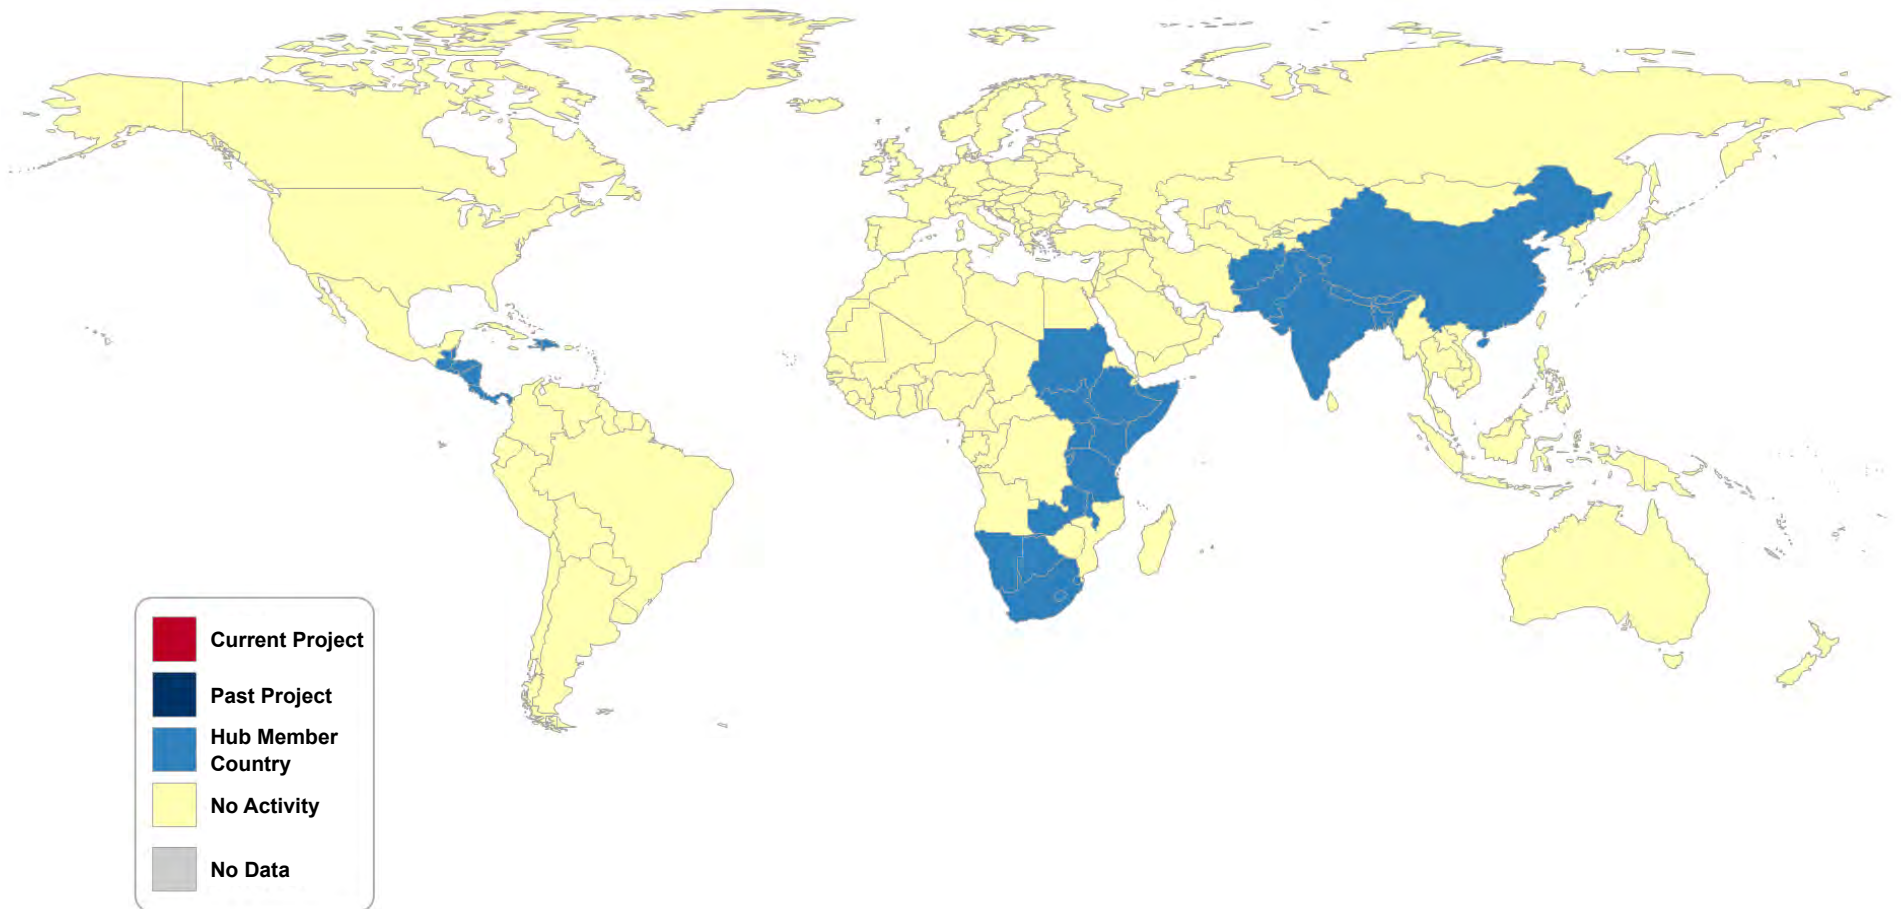

- World Bank
- UN
- GEO
- CEOS
- USWP
- Region-specific
  - Mesoamerica - e.g. Committee Regional Water Resources of Central America (CRRH)
  - East and South Africa – e.g. Intergovernmental Authority on Development (IGAD) Climate Prediction and Applications Centre (ICPAC)
  - Hindu-Kush Himalaya – e.g. South Asian Network for Development and Environmental Economics (SANDEE)

# Bhutan Water Resource Assessment using SERVIR GLOBAL Climate Change Scenarios and Hydrologic Model

Wangchu Basin in Western Bhutan, which feeds a critical reservoir atop a Hydroelectric power plant. Bhutan's 50% of GDP is generated by Hydroelectric power.

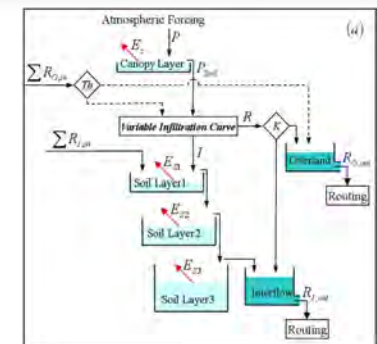

IPCC Ensemble Scenario Generation

Our preliminary analysis shows that the streamflow in early rainy season will be lower than historic amounts. The impacts on hydroelectric power generation can be severe. SERVIR plans to conduct additional analyses with Robertson data sets

CREST model calibrated using observed streamflow data

CC	0.88
NSCE	0.77
Bias(%)	-4.37

Mike Bosilovich, Co-I & Siegfried Schubert, Collaborator, both NASA/GSFC/GMAO

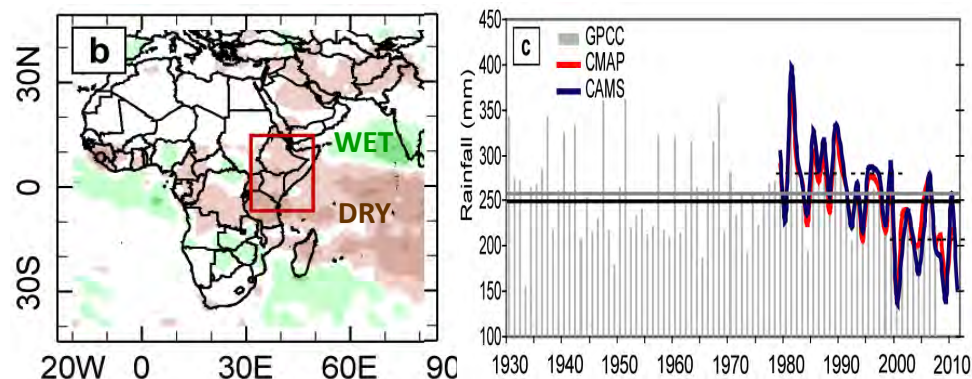

**A Big Challenge :**

## Identifying / Separating / Quantifying Natural Variability vs Anthropogenic Effects

- Critically assess and employ CMIP5 and US NMME climate model projections of seasonal / interannual / decadal hydrometeorological climate variability / change affecting SERVIR Hub regions (Mesoamerica, E. Africa, Himalayas).
- Develop and refine scenarios through downscaling, and stochastic modeling to provide SERVIR Applications Science Team and Hub Scientists with information to drive decision support system models of crop production, water availability etc.

**a)** CMIP models show 21<sup>st</sup> Century regionally varying precipitation trends (*top panel*) due to anthropogenic forcing. Note increased rainfall over East Africa. These expected changes will mix with natural climate variability (*lower panel*).

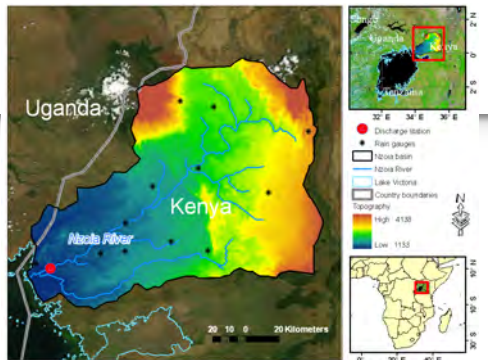

**b)** Satellite-observed Mar-May (1999-2010 avg) rainfall departure from 1979-2010 mean.

**c)** Mar-May observed and satellite-estimated rainfall averaged over East Africa (10S-12N, 30-53E). Why does this decadal trend contrast with model-projected increases?

Training and Capacity Building

Latest 24h/3h Stream Flow ( $m^3/s$ ) 2013-01-03 15h

Real Time, Historic and Seasonal Streamflow

# SERVIR Linking Earth Observations to Decision Making in Kenyan Energy Sector

- The near real time CREST hydrologic modeling has sparked the interest of a large scale electric utility in Kenya, KenGen.
- KenGen approached SERVIR Africa to better forecast the short-term and long-term reservoir levels using the CREST hydrologic modeling system, with an aim to help in releasing optimal quantities of water for hydroelectric power generation.
- KenGen currently does not assimilate earth observations in their analysis. SERVIR is helping them with hydrologic modeling, which include near time assimilation of satellite datasets.
- If SERVIR is successful, KenGen will be doing the same on their own shortly.

SERVIRGlobal.net 

SERVIRGlobal.net 

# SERVIR Reference Node

## Patterns (recipes)

SERVIR GLOBAL

Type of Source Data	Applied to	
Raster data sets updated in near real-time from data stored in custom binary format	<b>TRMM</b> data (every 3 hours), approximately 7 MB per interval. Data structure is suitable to enable custom geoprocessing of accumulated rainfall for user defined time intervals & areas of interest.	
Vector data sets updated in near real-time from data stored in ASCII files	<b>MODIS NRT Active Fire</b> data (every 5 minutes), approximately 1 MB per day. Data is converted to polygons for accurate spatial representation. Countries, sub-national regions and populated places merged with fire vector data to support queries & aggregations by place names.	
Raster data updated periodically, stored in HDF format tiles	<b>MODIS Land Cover</b> , updated yearly, approximately 88 MB per interval. Data is imported from sinusoidal tiles and reprojected to web-friendly map projection. Caching is handled by the ETL process for faster viewing performance.	
Vector data sets updated at irregular intervals, obtained as shapefile tiles	<b>OpenStreetMap</b> complex datasets, updated by crowdsourcing. ETL process handles aggregation of OSM features and cache creation.	

## Common characteristics to all patterns

- Handling of rolling archive and re-scan for missing data files (updates current and past periods within the archive interval).
- Multiple options for download (FTP/HTTP, compressed/uncompressed files)
- Ability to add post-processing tasks (for summarization or custom format export)
- Open/standard interfaces to map & data services (OGC based)
- Extensive ETL process logs
- Each pattern includes code and documentation to ease implementation for similar datasets thus facilitating capacity building.

## Automated Testing

- The reference node also includes a testing framework for quickly scanning OGC services to verify compliance to OGC standards and assesses performance.

# Other dissemination & collection approaches

SERVIR

- Fire applications & SMS service
- Mobile Apps
- Wireless sensor network
- ISS ISERV camera system

(Not to scale)

# How could ESIP help?

SERVIR  GLOBAL

- Could help get existing climate data layers not already on **SERVIRglobal.net** website into WMS or WCS web-friendly format – relates to ESIP GIS experiment described yesterday
- ISERV tech demo – potential data integration with data centers if extend to operational use
- How could we help end-users access earth observations from different entry points, e.g.
  - Societal Benefit Area – I am experiencing a drought, how can RS help me?
  - Geographic – I am a national user in Kenya and want to understand.... Or I am a local farmer in Kenya and want to understand...
- Could help us reach a broader audience with information of interest to NGO's, the public decision-makers
- Could help build capacity to understand climate data
- 2 hubs currently getting MODIS receivers – help us build their data management “good practices”?

# Thank you!
